

Partition operator

Partitioning data operations

- ✓ Partitioning operations are used to divide data source into two parts and return one of them as output without changing element positions.

Partition Operations Examples

- ✓ Select top n number of records from data-source.
- ✓ Select records from a data-source until a specified condition is true.
- ✓ Select all records except first n number of records.
- ✓ Skip records from a data-source until a specified condition is true and select rest all records.
- ✓ Can be used to implement pagination for a data-source.
