

Extend and operator

when we have a bunch of properties in one class and you want to inherit to another class you can use the

@extend and the property name

you can also override it

```
.main {  
  @include flexCenter(row);  
  width: 80%;  
  margin: 0 auto;  
  
  #{&}__paragraph1 {  
    font-weight: weight(bold);  
  
    &:hover {  
      color:  pink;  
    }  
  }  
  
  #{&}__paragraph2 {  
    @extend .main__paragraph1;  
  
    &:hover {  
      color: $accent-color;  
    }  
  }  
}
```

**you can perform normal operation
width : 80% - 40% in the result CSS
the it will just width : 40% remember
we can perform this only in the same
operators**
