

Generics

Making the component reusable is called generic

```
133
134 console.log(emp1.register())
135
136  Generics
137 function getArray(items: any[]): any[] {
138     return new Array().concat(items);
139 }
140
141 let numArray = getArray([1,2,3,4,5])
142 let strArray = getArray(['a', 'b'])
143
144 numArray.push('Iyyappan')
145 strArray.push(1)
```

It will accept the type dynamically and produce the result according to it

```
134 console.log(emp1.register())
135
136 //Generics
137 function getArray<T>(items: T[]):T[] {
138     return new Array().concat(items);
139 }
140
141 let numArray = getArray<number>([1,2,3,4,5])
142 let strArray = getArray<string>(['a', 'b'])
143
144 numArray.push(1)
145 strArray.push('sdff')
```

For this we have to use the <T> the T can be anything it will accept the input dynamically and provide the results
